

# Version 2 — Feature Overview

## What Version 2 Solves

---

Version 2 is about adoption. We'll build a new custom interface on top of the existing database. Simpler. More visual. Easier to access.

## Three Levels of Access

---

Version 2 introduces three ways to see the data. Each level shows more information and requires more trust.

### 1. Public Page

---

A page on the C2S website. No login needed. It shows a visual map and charts of where organizations/churches are active. No names. No sensitive information. Just a high-level view of global presence and gaps.

### 2. View Room

---

Requires a login. Read-only. Users see more details — leaders, churches, activities — but can't edit. The point: when people see that their country is empty while others are active, it creates a natural incentive to contribute.

### 3. Full Dashboard

---

Secure editing access. This is where leaders update their data. The interface will be clean and straightforward. Fewer screens, fewer clicks, less confusion, more visuals.

# Update Data by Chatting

---

Instead of navigating a dashboard, users can send a message. On WhatsApp, Telegram, or inside the app.(to be discussed)

It works like a conversation. Example: "Add a new leader in Colombia. His name is Carlos." The bot identifies the user, connects to the database, and makes the update.

This significantly reduces the effort needed to keep data current.

## Security options:

Option A — Standard AI

Data is processed on external servers. The AI only sees small fragments, never the full database. Easier to implement.

Option B — Self-hosted AI.

Data stays on our servers. More private. More work to set up.

We'll choose based on your security requirements.

# Simplified Login

---

The current login process is too complicated for most users.(2Fa Authenticator)

New process:

1. Enter your email and unique password.
2. Receive a 6-digit code by SMS.
3. Enter the code. Done.

That's it. no complicated process. And secure at the same time.

We could even remove the password entirely. As sms is secure enough.

# User Management

---

Currently, adding a user requires developer involvement. Version 2 removes that dependency.

Murray or other leader gets an admin interface. He can invite users, assign roles, and control access.

Regional leaders can also manage their own country leaders. They send an invitation by email. The person clicks a link, creates a password/sms verification, and has access.

Each regional leader only manages their own countries. Country leaders become responsible for their own data.

This structure supports scaling to 200+ users across the network.

## Automated Reports

---

Every 2 to 3 months, an email is sent automatically. It contains a visual summary with a map. What was updated. Where. By whom.

This can be shared in meetings or group chats. It keeps people informed and shows that the tool is active.

## Automated Reminders

---

If a country hasn't been updated in 2 months for example, the system sends a reminder. By SMS or email. Automatically.

Example: "Your country hasn't been updated in 2 months. Tap here to update."

Short and specific. Not a generic newsletter.

## Multi-Language Support

---

Users are spread across the world and speak different languages. Version 2 can automatically translate comments between users. Everyone reads and writes in their own language.

## Visual Upgrade

---

The new interface will be more visual.

- A 3D globe showing global activity.
- Interactive maps with zoom and filters.
- Clean tables with search functionality.
- Graphs that give a clear picture at a glance.

The goal is to make the data easy to read and navigate.

## Summary

---

No.	Feature	What it does
1	New custom interface	A simpler frontend on top of our current database
2	Three access levels	Public page, View Room, Full Dashboard
3	AI chatbot	Update data via WhatsApp, Telegram, or in-app
4	SMS login	Email + 6-digit code, no passwords
5	User management	Leaders invite and manage their own users
6	Automated reports	Visual email summaries every 2-3 months
7	Automated reminders	Nudges for inactive countries
8	Multi-language	Automatic translation of comments
9	Visual upgrade	3D globe, interactive maps, modern design
